Advances in Medicine

Blood and Guts

Galen: Gladiator Doctor

- Thought "Life Force" Flowed
- Liver is a Heater
- Accepted until the 16th century

Roman Medicine

+ No anaesthetics!

Roman Medicine: Bleeding

Charles Darwin wanted to be a doctor

- + What did he end up doing?
- Why did he not succeed in medicine?

Body Parts are related to each other

- + One discovery in early medicine was correct: Our body parts are related and dependant on one another in Body Systems:
- + Draw the chart on the board, with a partner list at least 10 body parts, give their function, and other body parts they relate to
- + All organisms also have some things in common (even paramecium and whales!!) Every organism needs these things in order to survive

Your Assignment: In Pairs

1. Complete the body parts chart (at least 10 parts)
 1. Share with another group!
2. Come up with 4 or 5 things that all organisms need to survive
3. Complete sections 1.0 and 1.1 in your notes booklet

What Characteristics do
all Living Things Have in
Common??

All living things are:

- + 1. Made up of cells

All living things

+ 2. Need Energy

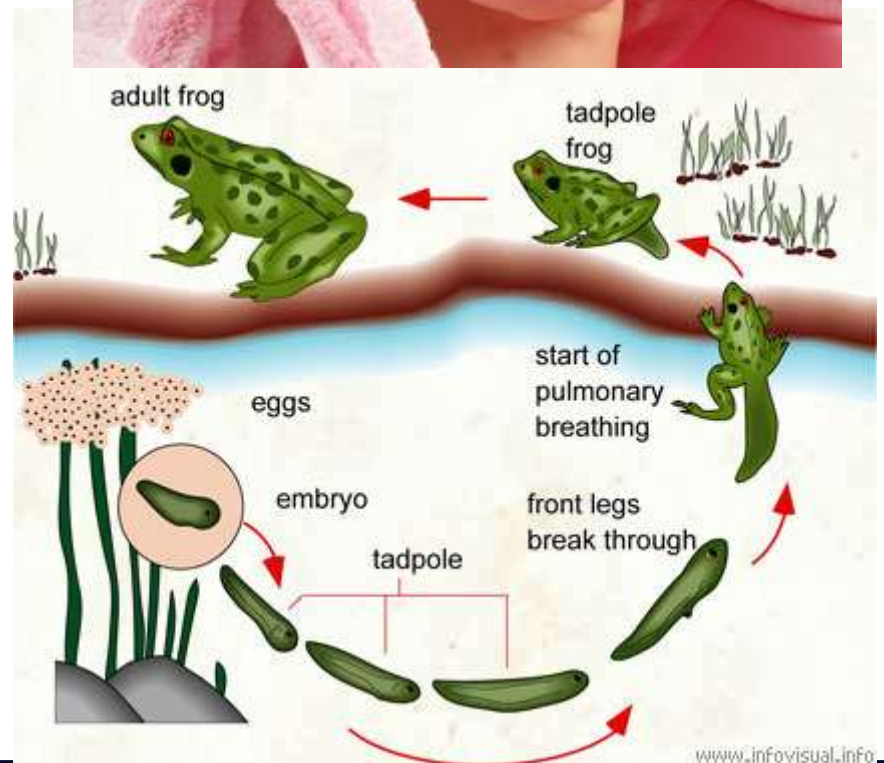

All living things

+ 3. Grow and Develop

Elizabeth Morales

All living things

- + 4. Respond to the environment (a stimulus triggers **response**). Can you think of other examples?

<http://www.youtube.com/watch?v=ktIGVtKdgwo&feature=fvst>
http://www.youtube.com/watch?v=K_INl1OgKsY

Lesson 16 Venus_Fly_Trap.asf

All living things

+ 5. Reproduce

<http://www.youtube.com/watch?v=DY9DNWcqxI4>

All Living Things

+ 6. Have Adaptations for their environment

- Other examples??

Certhidea olivacea
Probing bill, insect eater
Feeds in trees

Camarhynchus pallidus
Probing bill, insect eater
Uses twig or cactus spine
to probe insects from cactus

Camarhynchus heliobates
Grasping bill, insect eater
Feeds in trees

Camarhynchus crassirostris
Crushing bill, cactus seed eater

Structures versus function

- + **Structures:** The physical parts of an organism that perform a specific task. Eg) Teeth
- + **Function:** The purpose or the task completed by the organism Eg) Gaining energy (eating)

The Eye:
What are its structures?
What is its function?

Structures versus Function

+ Please complete this chart:

Animal	Structure	Function
Shark 	Teeth	
Venus Fly Trap 		Gain Energy
Polar Bear 		
Beetle 		Protection
Tree 	Leaves	
Butterfly 	Wings	
Your pick: Draw it:		

Your Assignment

1. Chart as a class
2. Notes: 1.0 – 1.3
3. Pick an Animal 😊 to research

What is a Cell?

Thought Web

How Did We Find Out About The Cell?

- + Early Microscopes
 - + The first compound microscope was invented in 1595
 - + Compound means two or more lenses
 - + In 1665, Robert Hooke used a three lens microscope to study the structure of cork

Why do you think he studied cork?

- + He wondered why cork was:
 - + So light
 - + Could float on water
 - + Firm, yet compressible

Hooke Examined Thin Slices of Cork

- + He found:
 - + Many empty chambers that he called "cells."
 - + These chambers were the remnants of living cells, the simplest functional unit of life

By the Council of the ROYAL SOCIETY
of London for Improving of Natural
Knowledge.

Ordered, That the Book written by Robert Hooke, M.A. Fellow of this Society,
Entituled, Micrographia, or some Physiological Descriptions of
Minute Bodies, made by Magnifying Glasses, with Observations and
Inquiries thereupon, Be printed by John Martyn, and James Allestry,
Printers to the said Society.

Novem. 29.
1664.

2. Notes: Up to 2.1

Structure	Plant Cell	Animal Cell	Function
Nucleus			
Mitochondria			
Cell Membrane			
Vacuoles			
Cytoplasm			
Cell Wall			
Chloroplast			

Monday January 14th

Complete the microscope
Handout using page 100 in
your science textbook.

Section 2: The Cell as an Open System

Today's Class: Cell Organelles

Parts of a cell video

Cell Organelles

www.slimfilms.com

Cell Membranes

Cell membranes are made of a Phospholipid By-Layer

ACELLULAR FLUID

Hydrophilic Head Hydrophobic Tail

Phospholipid By- Layers:

Phospho: Phosphate group that is POLAR makes the Hydrophilic head

Lipid: Fattys acids make the hydrophobic tail

Nucleus “The brain of the cell”

- + Contains DNA, contained by nuclear envelope, allows transport just like the cell membrane.

Cytoplasm (cellular fluid)

- + Fills cell, Contains nutrients for cell processes, all organelles are suspended in cytoplasm.
- + Cytoplasmic streaming:
- + <http://www.youtube.com/watch?v=8edk6nGMwMs&feature=fvw>

Endoplasmic Reticulum (the highway)

- + Smooth ER produces fats and oils
- + Rough ER have ribosomes attached for protein synthesis

Vacuoles and Vesicles (storage)

- + Membrane bound storage structures. Materials can enter a vesicle to be moved to a different part of the cell.
Lysosomes included

Lysosome

- + Contains strong chemicals that can digest molecules

Anatomy of the Lysosome

Ribosomes (protein builders)

- + Attached to rough ER or floating in cytoplasm
- + Responsible for protein synthesis

Golgi Apparatus (bag boy... or girl)

- + Packages substances (nutrients, etc.) for transport in the cell

Mitochondria (The Powerplant) (Start)

- + Converts chemical energy in sugars to ATP (Energy that cells can use) through Cellular Respiration

Cytoskeleton (The Frame)

- + Made up of microtubules and the protein actin.
- + Supports the structure of the cell, like the frame supports a house

Plant Cell specific organelles

- + Cell Wall. Rigid frame keeps cell in a consistent shape.

- + Chloroplasts: green, where photosynthesis takes place

Photosynthesis is a chemical reaction that plants use to make food.

Carbon Dioxide + Water + light -----> glucose + oxygen + water

Your Assignment

+ Cell Poster:

- Get together in groups of 2-3

- complete either a plant or animal cell, include labels with one sentence functions for organelles

- Label all structures to the right:

+ Cell membrane

+ Nucleus

+ Golgi Apparatus

+ Rough ER (with ribosomes)

+ Mitochondria

+ Lysosome

+ Plant? Cell wall, chloroplast.

Awesome interactive cell model

<http://learn.genetics.utah.edu/content/cells/insideacell/>

Making Playdough

Cell model project – cells and systems

Please Keep it clean! (I'm not your mom)

- **1. GATHER MATERIALS:**

- 100 ML BEAKER, TWO 400 ML BEAKERS, MIXING CONTAINER FOOD COLOURING
- ONE 400ML BEAKER IS TO REMAIN DRY, THE OTHER WILL BE USED FOR WATER

- **2. MIX IN PLASTIC CONTAINER:**

- 1000ML FLOUR (2X BRIMMING FULL + 200ML IN BIG BEAKER)
- 250ML SALT
- 30ML OIL

- **3. MIX FOOD COLOURING IN 300ML WATER**

- GRADUALLY ADD COLOURED WATER TO FLOUR/SALT/OIL MIXTURE
- KNEED AS YOU ADD WATER; ADD MORE WATER AS NECESSARY
- PLAYDOUGH SHOULD BE FIRM, NOT SLOPPY

STATION MUST BE SPOTLESS WHEN FINISHED

Single Celled Versus Multi Celled Organisms

Single (Uni) Celled

- + Amoeba
- + Diatoms (toothpaste,
- + Paramecium
- + Acetabularia

Acetabularia

"Stimulus, response! Stimulus, response! Don't you ever think?"

Amoeba and Paramecium

Single Celled protozoa. The amazing thing about uni-cellular organisms is that they can carry out all life functions inside a single cell! What life functions?

Amoeba and Paramecium

- + Amoeba use Pseudopods (false feet) to engulf and digest food. Called "phagocytosis"

- + Paramecium use fast beating cilia to move and sweep food into their oral grooves (mouths)

The Solution: Become Multi-celled

Do all cells in a multi-celled organism have to carry out all life functions?

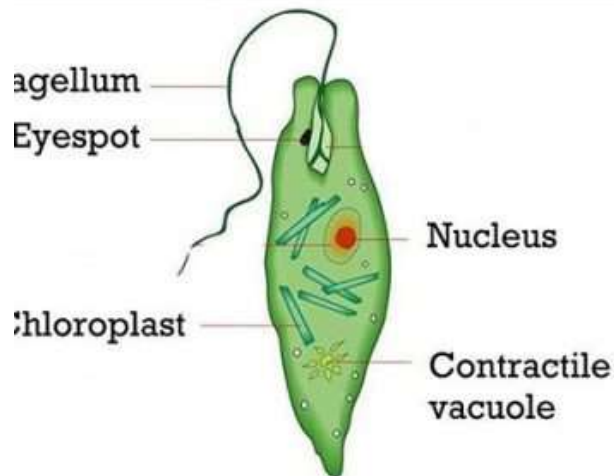

Unicellular vs Multicellular

Unicellular organisms must carry out all the same life functions as more complex multicellular organisms

UNICELLULAR ORGANISM

VS

MULTICELLULAR ORGANISM

The problem with Uni-
Cellular organisms:
How big is too big?

If all live processes are
carried out by a single cell,
why might size become a
problem?

Human Blastocyst

This is how we all start

The cells that make up the blastocyst are STEM CELLS.

They can differentiate into ANY type of cell in the body

Cell Differentiation: Remember GFP??

Stem Cells

Illustration by [Cell Imaging Core](#) of the Center for Reproductive Sciences.

Multi-cellular organisms have specialized cells

Cells that only have one specific function are more efficient, but can not survive on their own.

Your Assignment

1. C/R p 114
2. Finish notes up to 2.4

Skip 3 and 5

Notes

2.0 → 2.4

↓
finish earlier

How Substances Move Into and Out of Cells

- Tea Demo
- Food Colouring Demo
- Cold Air Demo
- Magic Test Tube Demo

- What causes this movement?

How Substances move in and out of cells (copy)

All cells in our body must be able to take in food, water, and gasses. They must also remove waste.

Diffusion is the movement of particles from an area of high concentration to an area of low concentration

Diffusion

● solute

Solute transport is from the left to the right; movement of the solutes is due to the concentration

Selectively Permeable Membrane

Cell membranes are selectively permeable:

They have openings to allow nutrients in and waste out, but prevent large particles from entering the cell

The cell membrane and osmosis

The diffusion of water through a selectively permeable membrane.

<https://www.youtube.com/watch?v=7-QJ-https://www.youtube.com/watch?v=7rX1jNDUsXU>

<https://www.youtube.com/watch?v=A8cl6FkcG4c>

Pg 115 / 116

Draw these two diagrams on paper

Diffusion

Start:

Finish:

The Salt particles have diffused from an area of **high** concentration to an area of **low** concentration to achieve a balance (equilibrium)

Osmosis

Selectively Permeable Membrane
• = Water particles
● = Solute particles too large to pass through the membrane

Water particles diffuse across the semi permeable membrane to achieve a balance (equilibrium)

OSMOSIS IN RED BLOOD CELLS

Your Assignment

C/R p 119 # 1, 2, 3, 5

Notes Catch Up

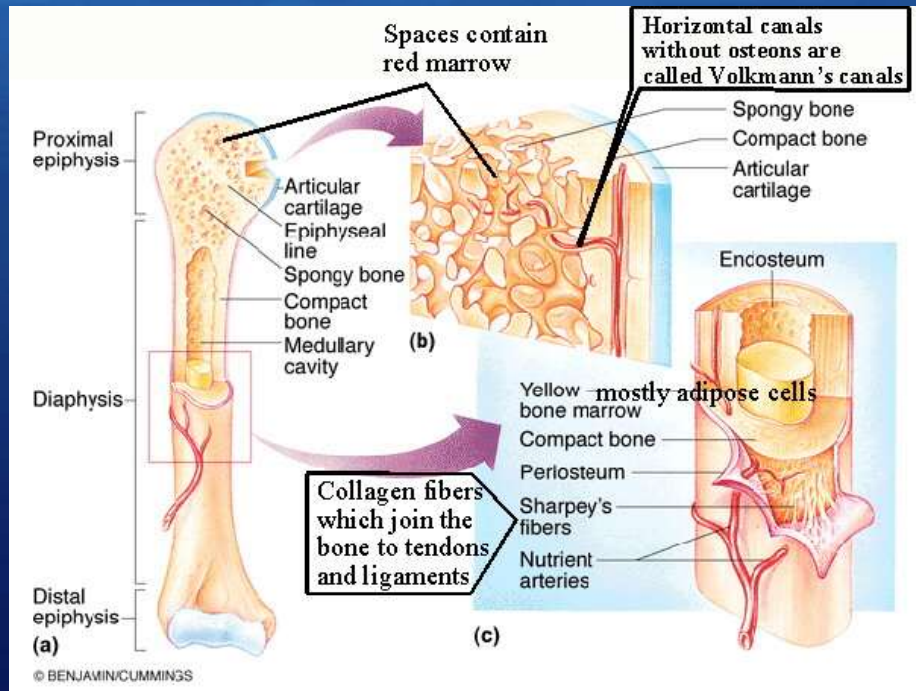

Tissues and Organs

Similar Cells in your Body form tissue. Together, tissues form organs

To form tissue, cells must grow and divide

Your body replaces 50 million skin cells every day... (where do they go?)

Specialized Cells

Cells in a multicellular organisms specialize.... This means each type of cell has a specific function, and the organism could not survive without each type of cell working together.

What do red blood cells specialize in?

What do white blood cells specialize in

What do bone cells need to be?

Why are nerve cells built the way they are?

Bone Marrow

Bone Marrow is a specialized type of tissue?

What function does bone marrow perform?

Bone Marrow Produces

**White
Blood Cells**

Fight Infection

**Red
Blood Cells**

Carry Oxygen

Platelets

Control Clotting

Similar Cells Form Tissue

Four main types of tissue make up almost all of your organs

Four types of tissue

Connective tissue

Epithelial tissue

Muscle tissue

Nervous tissue

Histological images of various tissues in the body

These tissues all fit into one of the categories

Bone

Cartilage

Adipose Tissue

Skin

Intestinal Villi

Neural Tissue

Cardiac Muscle

Skeletal Muscle

Plants also have Tissue

Plants have 3 tissue types:

- Photosynthetic / storage

- Protective

- Transport (phloem transports food, xylem transports water)

- Each of these types of tissues exist in the leaves, the stems, and the roots

Your Assignment

- Tissues of Humans and Plants handout
- Finish notes up to 3.0

Section 1 / 2 Review

Parts of the Microscope

of connective tissue which creates red blood cells

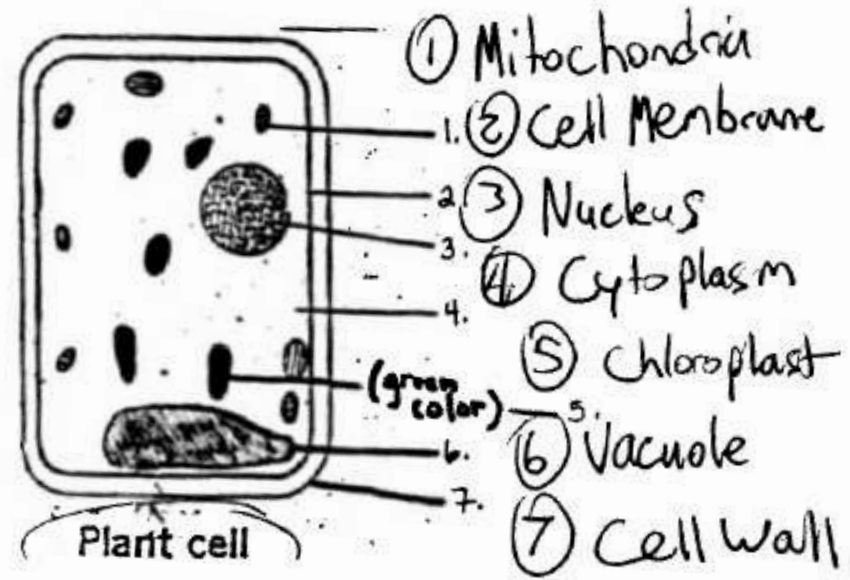

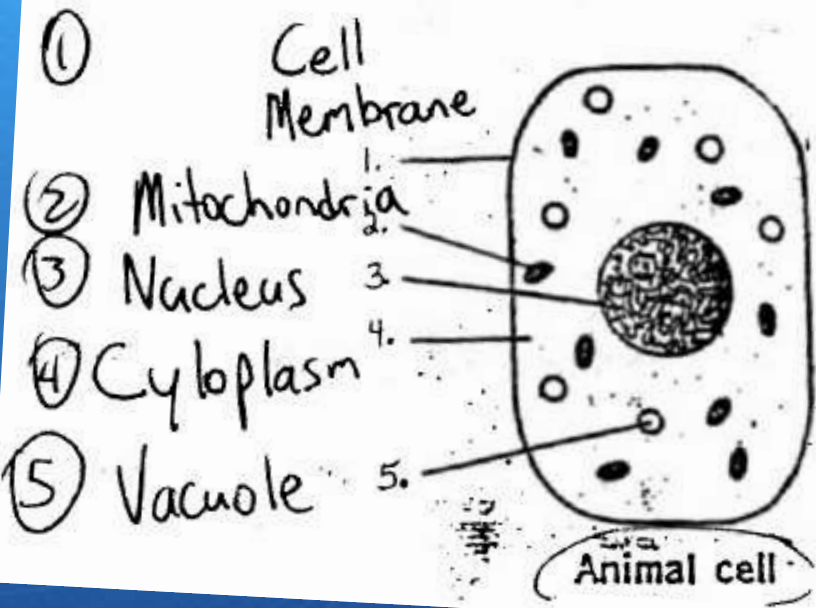

Cells - The Basic Unit of Life

Define and describe the following terms:

1. **capillaries** tiny blood vessels, only one cell thick that connect Arteries to veins
2. **tissues** A group of similar cells working together to perform a similar function
3. **organelles** Structures in cells that perform specific functions

Using a ruler, create and complete the following chart:

Cell Structure	Description	Function
a) cell membrane	thin fluid-like membrane	Controllable Gateway
b) cell wall	Thicker/Solid	Frame For Plant Cell
c) cytoplasm	Fluid in Cell	Contains Nutrients
d) nucleus	Sphere, w Membrane	Brain/Command Center
e) vacuoles	Small spheres	Storage Rooms
f) mitochondria	Kidney Shaped	Power Plant, Make E.
g) chloroplasts	Green Blobs	Make Sugar For Plants.

Single Celled or Multicelled Organisms

Cells are the individual, living units that make up all living organisms. Organisms that are made of two or more cells are Multicellular. Multicellular organisms rely on many Specialized cells to perform the functions required for life. Examples of multicellular organisms are humans, Trees, and Frogs.

If an organism is made of only one cell it is called

Uni-Cellular. An example of a unicellular organism is the Amoeba. A unicellular organism can perform all of the functions of a multicellular organism. Unicellular organisms eat, move, react, get rid of waste, and reproduce.

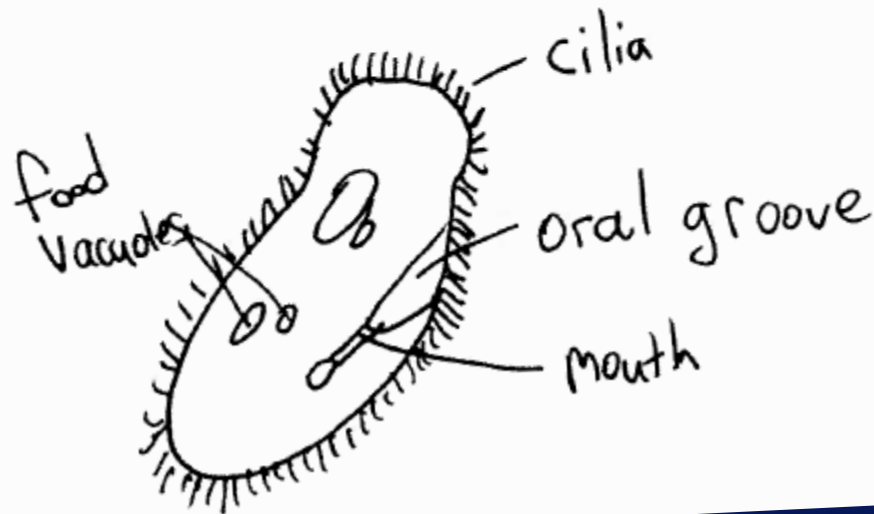

Common Unicellular Organisms

For each of the following provide a labelled diagram and a written description:

Amoeba

Paramecium

Diffusion and Osmosis

The movement of particles from an area where there is more of them to an area where there are fewer of them is called diffusion. Molecules move from areas of high concentration to areas of low concentration.

Diffusion can occur in a liquid or a gas.

Diagram of diffusion: Start

Finish

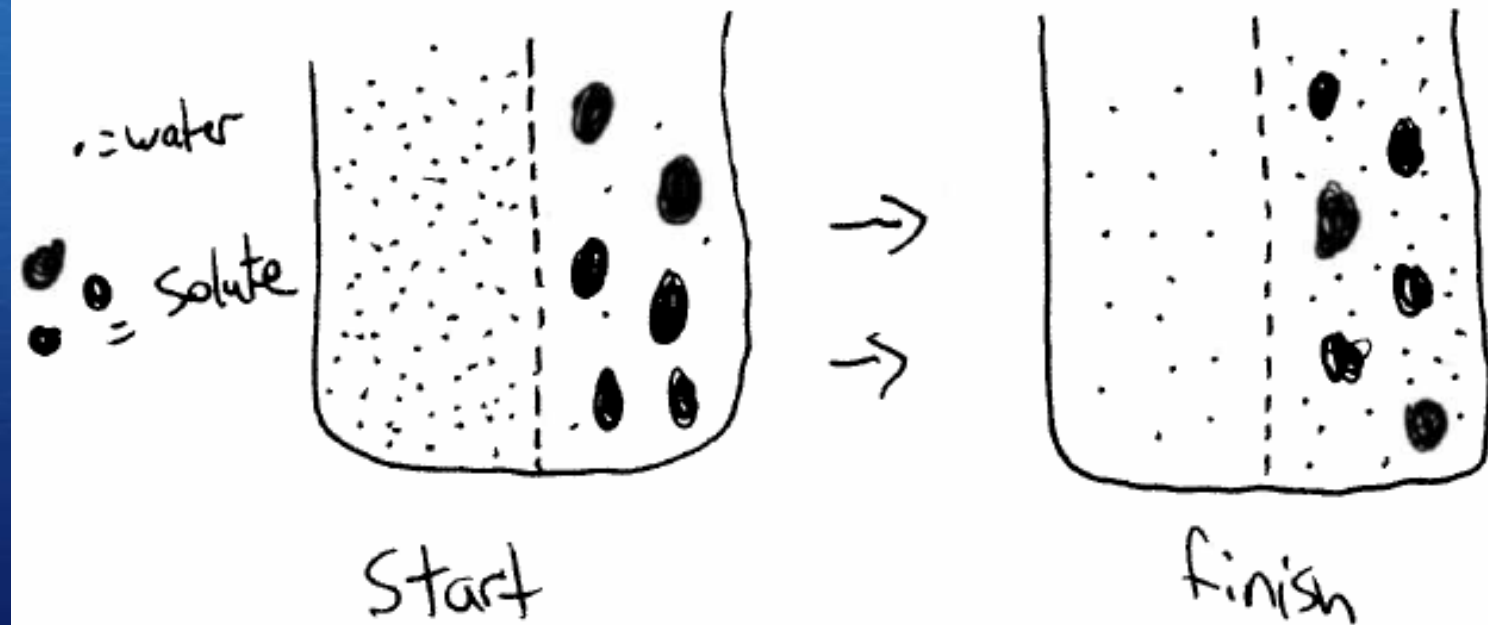

Selectively permeable membranes only allow some particles to move across.

Plant roots do not allow dirt and large particles to enter the plant.

Osmosis is the diffusion of water through a selectively permeable membrane. In osmosis the particles move from an area of high concentration to low concentration.

Diagram of osmosis:

2.5 Specialized Cells

A. Reproduction:

All cells produce by Cell division. The cell division results in two identical copies of each organism. Your body replaces 50 000 000 skin cells each day.

B: Multicellular Organisms Have Specialized Cells

Each specialized cell has a different function. Your red blood cells carry oxygen to all cells of your body. Red blood cells have a thin, pliable disk shape that allows them to travel through very small blood vessels. Red blood cells are made in the Marrow of your bones. To reproduce the red blood cell does not divide, it is ~~created~~ replaced by new red blood cells in the marrow.

B. Tissue

Define/explain each of the following terms and provide an example for each:

1. **Connective tissue** Supports and connects diff. parts of the body
ex.) Blood
2. **Epithelial tissue** Skin / **organ covers**
3. **Nervous tissue** Brain, Spinal Cord, nerves
4. **Muscle tissue** Allows you to move
- muscles, heart.

C. Tissues in Plants

Draw, using a pencil and ruler, the following chart. Complete the chart.

Role of Specialized Tissues in Plants

Tissue Type	Stem Cells	Root Cells
Protective Tissue	Waterproof Layer to protect plant	Absorb H_2O from soil
Transport Tissue	Phloem: food Xylem: water	Phloem, Xylem in circle
Storage Tissue	Support plant, store food	Store food

All living things are:

- + 1. Made up of cells

All living things

+ 2. Need Energy

All living things

+ 3. Grow and Develop

Elizabeth Morales

All living things

- + 4. Respond to the environment (a stimulus triggers response). Can you think of other examples?

<http://www.youtube.com/watch?v=ktIGVtKdgwo&feature=fvst>
http://www.youtube.com/watch?v=K_INl1OgKsY

All living things

+ 5. Reproduce

<http://www.youtube.com/watch?v=DY9DNWcqxI4>

All Living Things

+ 6. Have Adaptations for their environment

Certhidea olivacea
Probing bill, insect eater
Feeds in trees

Camarhynchus pallidus
Probing bill, insect eater
Uses twig or cactus spine
to probe insects from cactus

Camarhynchus heliobates
Grasping bill, insect eater
Feeds in trees

Camarhynchus crassirostris
Crushing bill, cactus seed eater

- Why are Darwin's finches a good example of structure versus function?

- Because they have different structures to perform a similar function

Cactus Adaptation: Spines

+ Where have humans copied this?

Insect Adaptations: Spiracles.... Why?

↳ Breath

Structures versus function

- + **Structures:** The physical parts of an organism that perform a specific task. Eg) Teeth
- + **Function:** The purpose or the task completed by the organism Eg) Gaining energy (eating)

The Eye:
What are its structures?
What is its function?

Metabolism

+ Energy is the ability to make things move or change and is needed by all organisms. The sum of all the different processes that happen in an organism is called

Metabolism.

+ **Metabolism is how we make energy**

and use

Structural vs Behaviour Adaptations

- + **Structural: What it looks like**
- + **Behavioural: What it acts like**
- + **Classify the following as behavioural or structural adaptations:**
 - + Snowshoe hare grows white fur
 - + Cactus has spines
 - + Birds fly south
 - + Giraffes have long necks
 - + Mice only come out to feed at night

How life is built

- + Cells form Tissues
- + Tissues form organs
- + Organs form systems

- + That's it! Study hard, and good luck on the test!

Section 3: Tissues and systems of the human body

What are the systems in our body?

What organs make up those systems?

How do the systems work together?

Which organs do you recognize?

Working together

Our systems must: (Copy into Notes please)

React: respond to changes inside and outside.

Interact: Work together as a single unit to carry out life functions.

[Breaking_Down_Digestion.flv](#)

The Digestive System

[Introduction_to_the_Digestive_System.flv](#)

What does the digestive system do?
What Organs are Involved?

3.1 The Digestive System

+ Living organisms need energy from carbohydrates (sugars), lipids (fats), and proteins to survive. It's all about absorbing nutrients!

Starches

oils

+ Types of Digestion: **Physically rip food apart**

+ Turn to page 127 and define Mechanical digestion, Chemical Digestion, and Enzymes (Use the glossary for enzymes)

→ Using acids + enzymes

Food's Path

+ The mouth and Esophagus:

+ The digestive system is a long tube. It starts at the mouth and ends at the rectum

Copy: Mouth and Esophagus

+ Mouth: Teeth mechanically break down food by grinding it and mixing it with saliva.

+ Saliva moistens food and has an enzyme that breaks down starch (like potatoes) into simple sugars.

+ Food moves down the esophagus and into the stomach

The Esophagus

- Joins the mouth to the stomach
- Peristalsis: The muscles in the esophagus contract (squeeze) to push food into the stomach (copy)
- Like a tube of toothpaste!

Through the Esophagus The Function of Peristalsis.flv

Your Assignment

- Label “The Human Digestive System” using pages 128 and 130.
- If you finish, continue filling in the 3.1 notes.
- Please work quietly :)

The Digestive System

Continued

The Stomach:

As food enters the stomach, muscles in it's walls churn food back and forth.

(Copy): Gastric Juice is made of mucus, hydrochloric acid, water, and enzymes. It helps digest proteins.

inside my stomach? - jump

The Digestive System Continued

Small Intestine, Pancreas,
Liver, Gall Bladder (copy)

Chemical digestion: The pancreas sends digestive enzymes into the small intestine to break down carbohydrates and protein.

The Liver produces bile which is stored in the Gall Bladder. The bile then travels to the *S.I.* where it digests lipids (fats)

The Digestive System Continued

Villi: (Copy)

-Small finger-like projections that the small intestine folds into to increase surface area.

If one person's small intestine were completely unfolded, it would cover the classroom floor!

The Digestive System

Continued

Copy under microvilli

Villi are covered with tissue that absorbs nutrients. It also folds to form even smaller fingerlike projections (microvilli).

The Digestive System Continued

The Large Intestine (copy)

1.5 m long

Digestion is now complete.
The *L.I.* absorbs water,
vitamins and minerals.

The remaining food forms
feces which is collected in the
rectum.

Your Assignment

- Check and Reflect: p 131
 - # 1, 2, 3, 4, 6. (for homework)

Please work quietly, we will mark it at the end of class.

<https://www.youtube.com/watch?v=b2oVRRgC37Q>

Name

Digestive
System Quiz (12 marks)

Digestive Quiz

1. The digestive process starts in the
 - a. Stomach
 - b. Esophagus
 - c. Mouth
 - d. Kitchen

Digestive Quiz

2. List the four things found in your stomach's Gastric Juices (4 marks)

Digestive Quiz

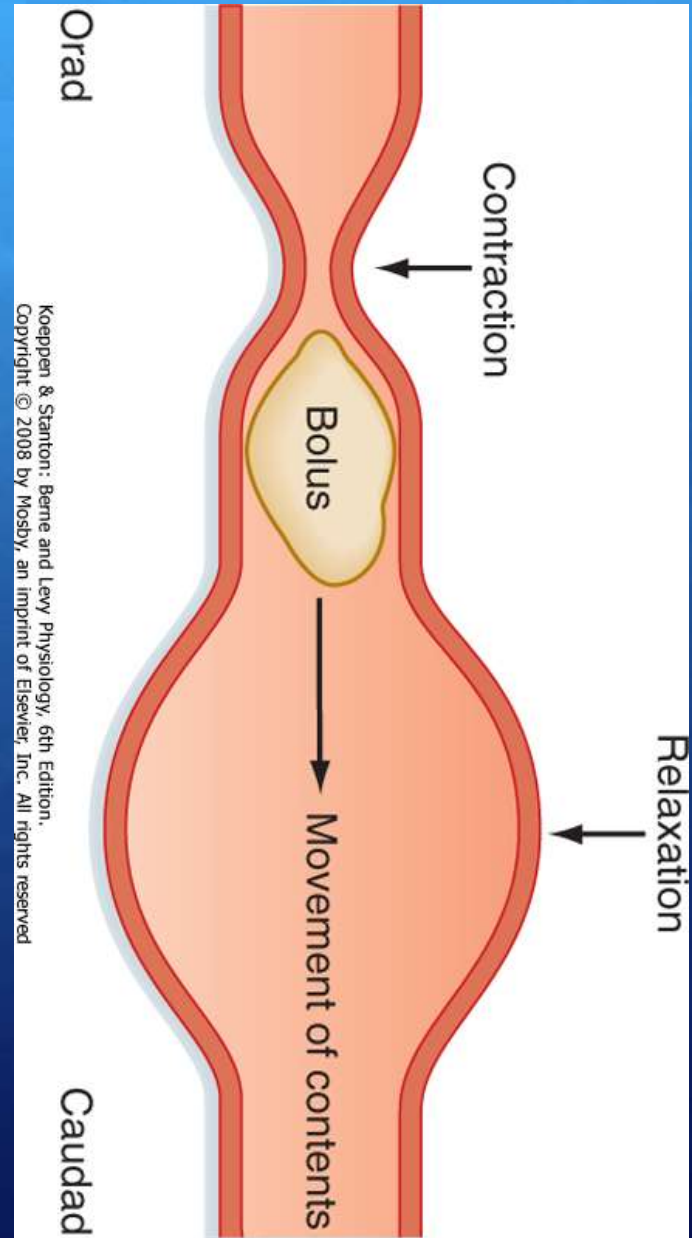

3. Example(s) of Mechanical Digestion is / are
- a. Teeth Physically Ripping food apart
 - b. Enzymes in saliva breaking down starches
 - c. Stomach churning and squeezing food
 - d. a and c

Digestive Quiz

4. Food is squeezed down the esophagus via

- a. Gravity
- b. Defecation
- c. Chewing
- d. Peristalsis

Digestive Quiz

5. Which organ products bile?

- a. Pancreas
- b. Liver
- c. Gall Bladder
- d. Stomach

Digestive Quiz

6. Your small intestine is folded into **villi** to
- a. Provide more area for food to touch the lining of the intestine
 - b. Increase surface area
 - c. Make nutrient absorption more efficient
 - d. All of the above

Digestive Quiz

7. Your large intestine absorbs

- a. Proteins and Lipids
- b. Water, Vitamins and Minerals
- c. Carbohydrates and Lipids
- d. Toxic Waste

Digestive Quiz

8. The point of your digestive system is to absorb _____ into the _____

러닝머신

Running Machine

Breathing

How do we breath??

What actually causes us to breath?

Paper Bag experiment

medulla oblongata

Paper Bag Experiment

1. While seated and relaxed, count how many breaths you take in 30 seconds. Times this number by 2 to calculate breaths per minute.
2. Take a paper bag and seal it around your mouth and nose. For the first 30 seconds breath into the bag without counting, then for the next 30 seconds count how many breaths you take and times by 2 for B.P.M.
3. What change did you notice... Why did this happen?
4. ****OPTIONAL, DO NOT DO THIS IF YOU HAVE A HEART OR BREATHING CONDITION****

Paper Bag Experiment

1. You should have noticed that when you breathed into the bag for 30 seconds, and then counted, you had to take several more breaths than breathing normally
2. This is because you are breathing out CO₂ into the bag (Cellular waste!) The amount of CO₂ in your lungs is measured by your Medulla Oblongata (in your brain stem). Too much CO₂ causes you to take in a new breath
3. This is why you can hold your breath until you pass out, but as soon as you are unconscious your medulla oblongata kicks in and makes you breath again!

The Respiratory System

Supplies your blood with fresh oxygen and removes carbon dioxide waste

The Human Respiratory System

Nasal passage nose

Oral cavity mouth

Pharynx

Larynx

Trachea

Bronchi

Lung

Heart

Ribs

Alveoli

Diaphragm

Breathing

Copy

Diaphragm: Large muscle below the lungs that helps move air in and out of the lungs

- Breathing in:

- The muscles in your torso contract, pulling the ribs up and the diaphragm down
- The lungs get bigger and clean air is pushed in (oxygen)

- Breathing out:

- The muscles relax (ribs in, diaphragm up)
- The lungs get smaller and push dirty air out (carbon dioxide)

The Gas Exchange Process

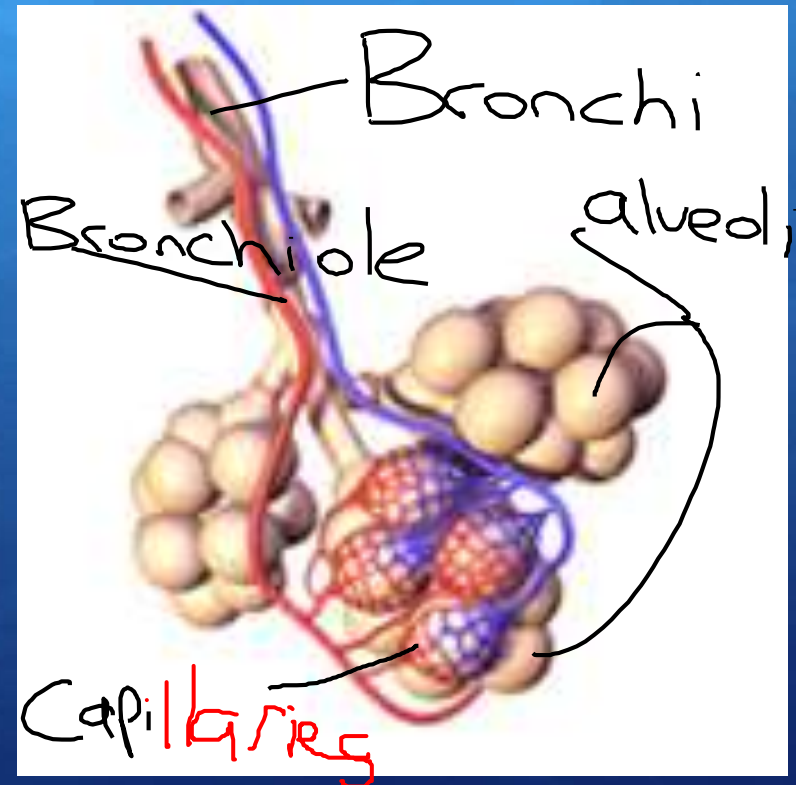

Bronchi – two main branches off of the trachea that lead into the lungs

Bronchioles – tubes that connect bronchi to air sacks (alveolus) in lungs

Alveoli – Tiny air filled sacs in the lungs. The site of gas exchange

Draw the diagram from the white board into your notes.

Lung Lobes

GAS EXCHANGE

Alveoli

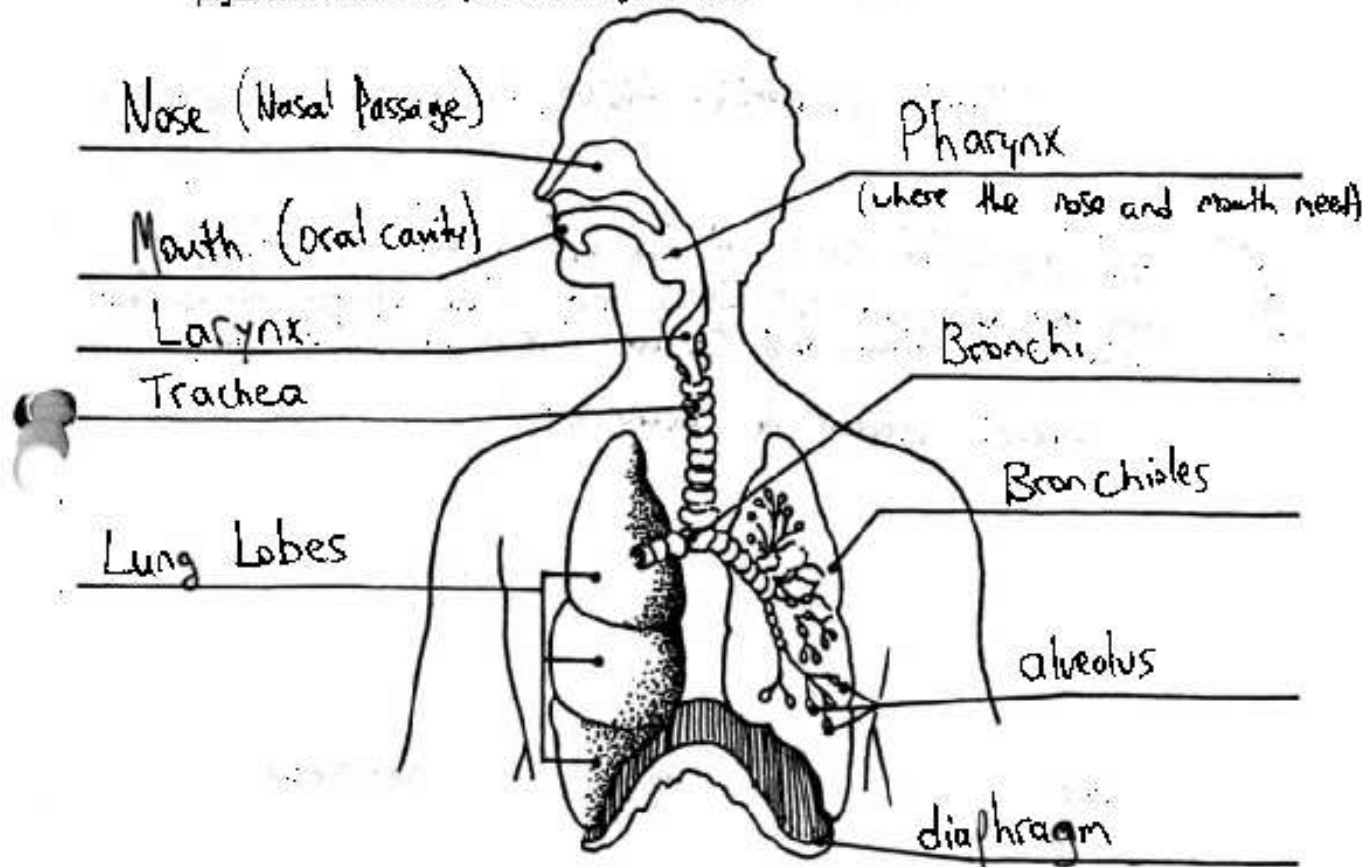

The Respiratory System

Your body needs oxygen in order to survive, and it also must rid itself of carbon dioxide. Both of these needs are met by breathing. Breathing is the process your respiratory system uses to move air in and out of your lungs.

Using your knowledge of the *Respiratory System* and your *Science in Action* textbook, pages 132-134, correctly label the diagram below.

Unit 8: Cells and Systems
Topic 3.2 Respiratory System
Vocabulary Exercise

1) Breathing occurs because of your rib cage and diaphragm muscles. When you inhale these muscles contract, pulling your ribs up and your diaphragm down.

2) A. The respiratory system draws air into the lungs through a series of tube-like passageways called bronchi.

B. Describe what these passageways are made of and why they are made of such material?

- Tough connective tissue to keep from collapsing

3) What are alveoli and what do they do?

Tiny air filled sacs at the end of each bronchiole.

They are only one cell thick and allow oxygen to diffuse into your blood, and Carbon dioxide to diffuse out.

4) What role do bronchioles play in the respiratory system?

Connect bronchi to ~~bronchioles~~ alveoli

5) Your body needs oxygen in order to survive. What waste gas must it rid itself of?

4) What role do bronchioles play in the respiratory system?

Connect bronchi to ~~bronchioles~~ alveoli

5) Your body needs oxygen in order to survive. What waste gas must it rid itself of?

CO_2

6) When you exhale your diaphragm and rib muscles relax. In this case, your ribs go down and your diaphragm goes up. This decreases the size of your chest and lungs which forces air out.

7) Describe, in order, the pathway of air into the lungs.

Nose/Mouth, Pharynx, Larynx, Trachea, Bronchi,
bronchioles, alveoli, blood

capillaries
In lungs

Factors that affect the respiratory system

The biggest factor is.....?

Your Assignment

Respiratory Quiz

1. The arrow is point to

- a. Bronchioles
- b. Bronchi
- c. Alveoli
- d. Trachea

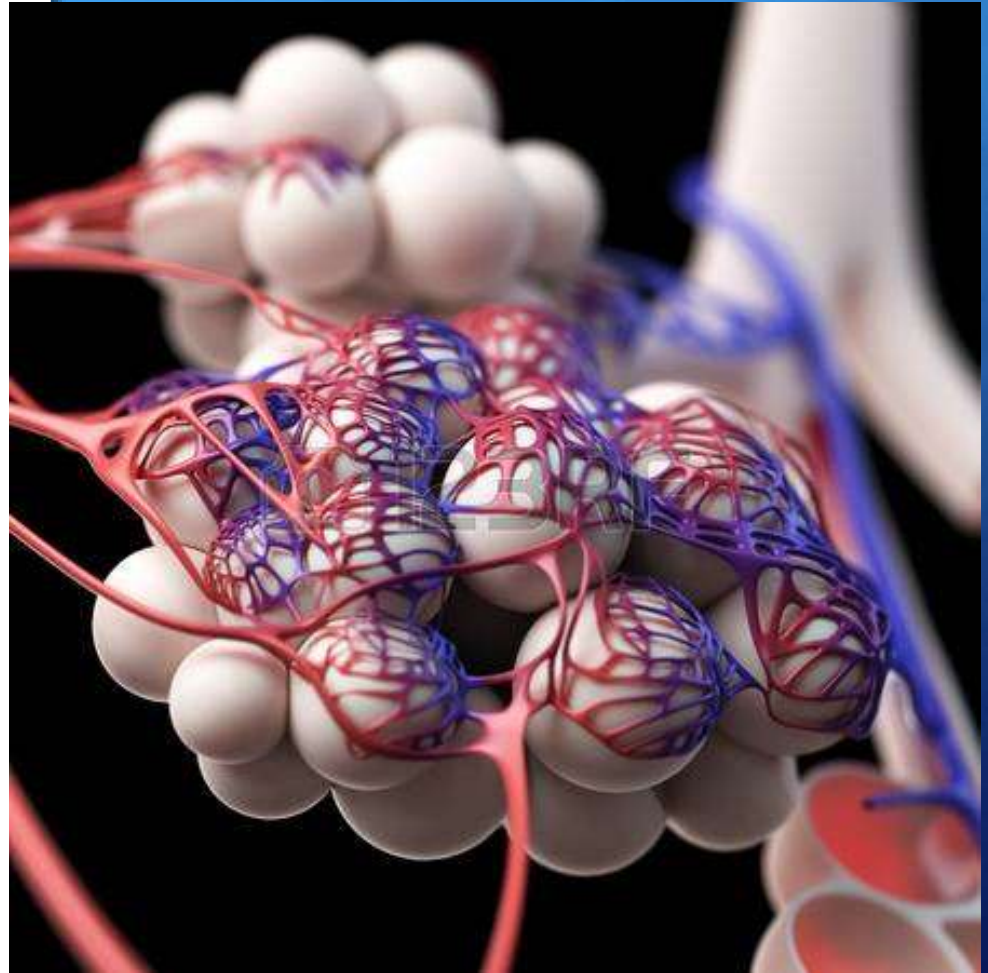

2. This diagram represents
- a. Oxygen Diffusing into Blood
 - b. Carbon Dioxide Diffusing out of Blood
 - c. Gas Exchange
 - d. All of the above

Digestive, Respiratory,
Circulatory Quiz

Respiratory Quiz

3. Alveoli are always surrounded by

- a. Capillaries
- b. Bronchi
- c. Gastric Juices
- d. Trachea

Respiratory Quiz

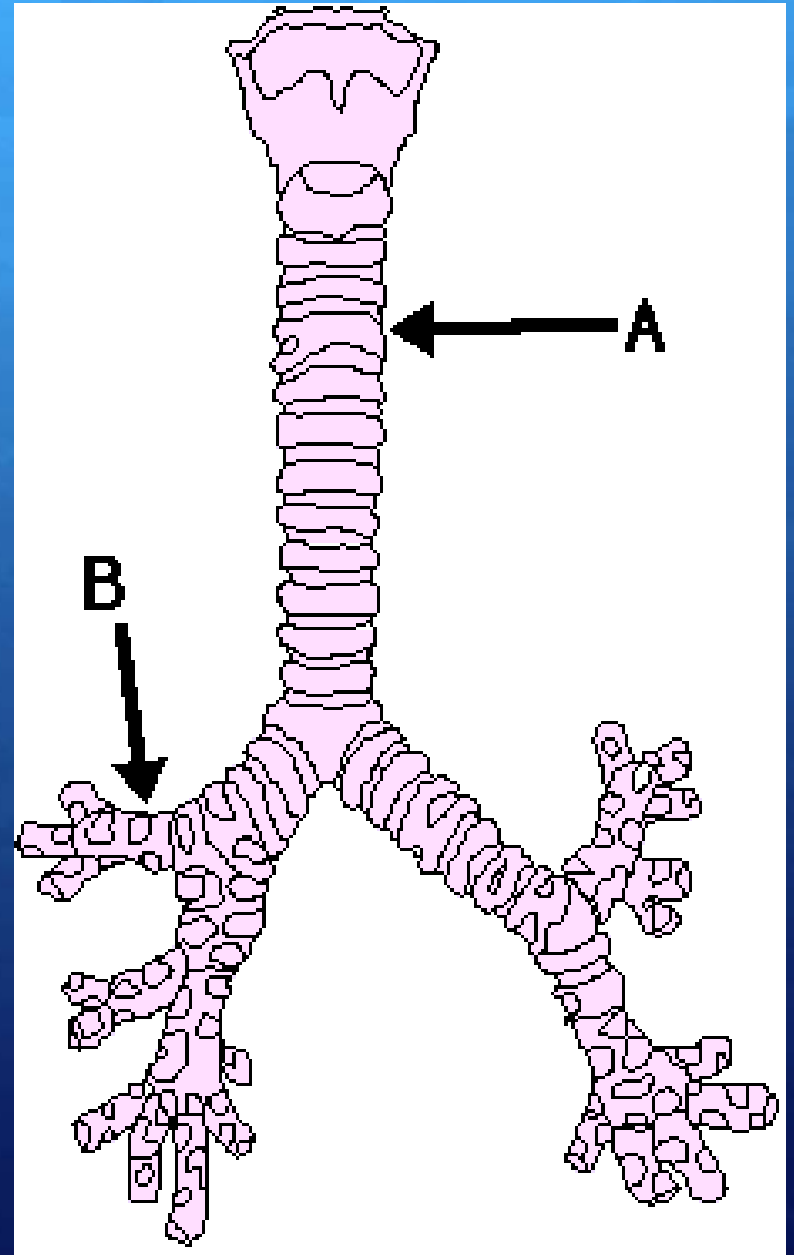

4. BREATHING IN involves
 - a. Much concentration
 - b. Diaphragm relaxing and raising, rib cage dropping
 - c. Gastric Juices
 - d. Diaphragm contracting and dropping, rib cage rising

Respiratory Quiz

5. A is pointing to

- a. Bronchioles
- b. Esophagus
- c. Trachea
- d. Pharynx

Respiratory Quiz

6. Which is true about the RESPIRATORY system
- a. It delivers oxygen to the blood
 - b. It delivers nutrients to the blood
 - c. Removes Carbon Dioxide waste from blood
 - d. A and C

Respiratory Quiz

7. What toxic waste product builds up in blood, triggering an exhale?

- a. Oxygen
- b. Carbon Dioxide
- c. Ammonia
- d. Bile

Respiratory Quiz

8. What part of the brain detects waste buildup in blood, triggering an exhale?

- a. Cerebral Cortex
- b. Uvula
- c. Medulla Oblongata
- d. Hypothalamus

Respiratory Quiz

9. BREATHING OUT involves

- a. Much concentration
- b. Diaphragm relaxing and raising, rib cage dropping
- c. Gastric Juices
- d. Diaphragm contracting and dropping, rib cage rising

Respiratory Quiz

10. What happens to your respiration rate while exercising? Why? (2 marks)

Respiratory Quiz

11. What would happen to your respiration rate if you breathed into a paper bag for five minutes? Why? (2 marks)

Circulatory System "Transportation Network"

Delivers nutrients and oxygen to every cell, then removes those cell's waste products. *(metabolic waste)*

The Heart

- A combination of 2 pumps: (Right side and left side)
 - Right side pumps “used” blood into your lungs
 - Left side pumps oxygen-rich blood from the lungs to your body
-
- Atria: Top two chambers of the heart
 - Ventricles: Bottom two chambers of the heart
 - Get up! Heart Rate Activity

Mr. Greve's EXPECTATIONS

Be Respectful		Work Hard
Be on Time	Sit in Assigned Seats	Stay on Task
One person speaks, everyone else listens	Raise your hand to ask / answer questions	Bring the proper materials to class

Oxygen Rich Blood

Deoxygenated Blood

Circulatory System

The Path of Blood: copy diagram as well

1. **LEFT VENTRICLE** squeezes oxygen rich blood to aorta
2. **AORTA** distributes blood to major arteries
3. **ARTERIES** take oxygen rich blood to body
4. Oxygen diffuses into body's cells and carbon dioxide diffuses out in **CAPILLARIES** (GAS EXCHANGE). Blood is now deoxygenated

RED: OXYGENATED BLOOD (O₂ RICH)
BLUE: DEOXYGENATED BLOOD

5. Blood returns to heart in **VEINS**
6. Blood enters **RIGHT ATRIUM**
7. Blood passes a valve into the **RIGHT VENTRICLE** where it is squeezed into the **PULMONARY ARTERY**
8. **PULMONARY ARTERY** takes blood to lungs
9. **CAPILLARIES** in lungs release carbon dioxide from blood and take in oxygen (GAS EXCHANGE). Blood is now oxygenated
10. **PULMONARY VEIN** returns blood to heart
11. Blood enters **LEFT ATRIUM** then passes through a valve to the **LEFT VENTRICLE**

Arteries, Veins, Capillaries

The Body has 100000 km of blood vessels

Arteries: Oxygen-rich blood is pumped away from the heart to the body in arteries (pulse)

Veins: Blood and waste products (CO_2) return to the heart in veins

Capillaries: Where gas exchange takes place. Made of epithelial tissue only 1 cell thick to allow for diffusion of O_2 and CO_2 .

~~Thin and narrow~~

The Blood

55% plasma: Liquid: Holds Nutrients and CO₂

45% red blood cells (carry O₂), white blood cells, and platelets

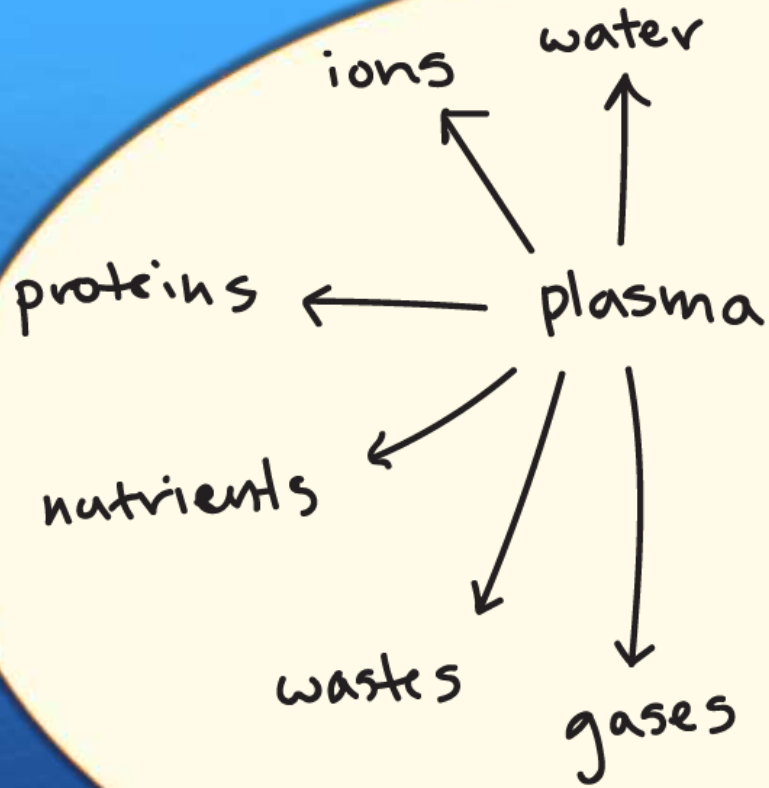

White Blood Cells: Specialized cells to fight infection [The Angry Macrophage](#)

Platelets: Help stop bleeding of cuts

Billy Nye, Heart: 0 – 5:10

white blood cells + platelets

red blood cells

USING THE DIAGRAM ON
PAGE 137, List the path blood
takes from the left ventricle, to
the body, and back to the left
ventricle. USE ALL OF THE
LABELS PLEASE

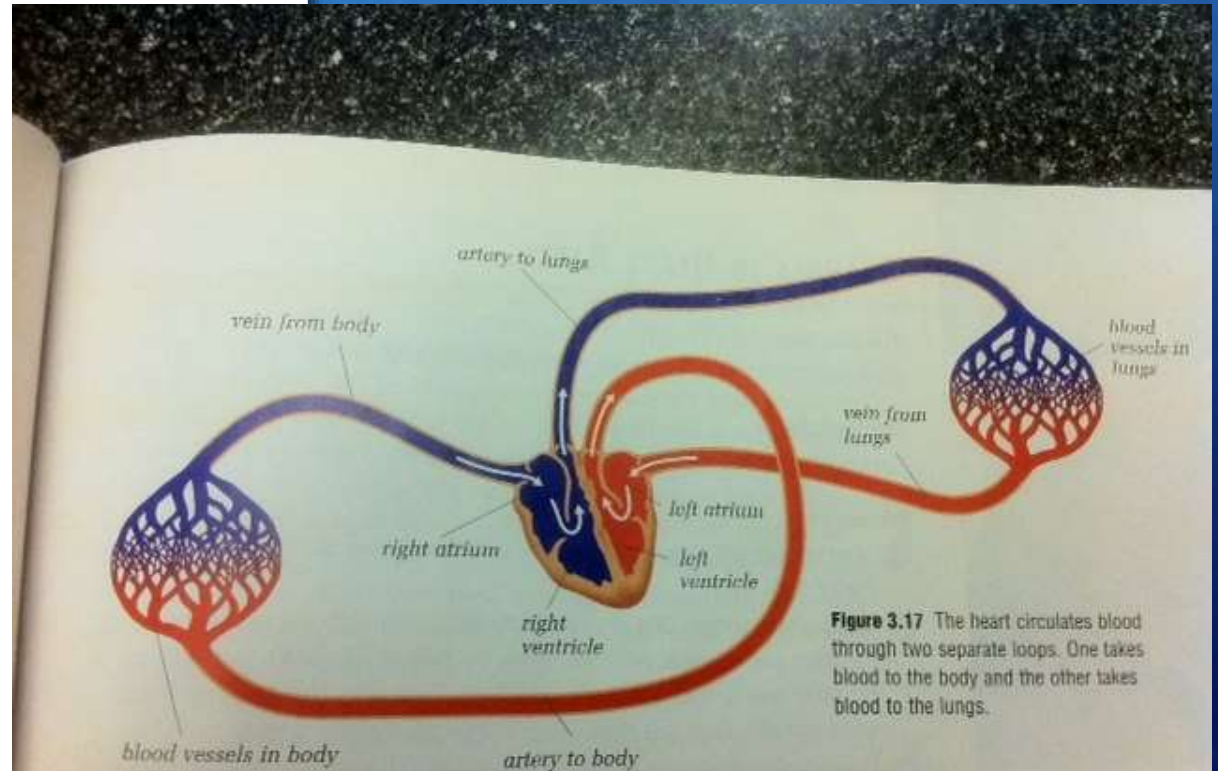

Figure 3.17 The heart circulates blood through two separate loops. One takes blood to the body and the other takes blood to the lungs.

Your Assignment

Heart Handout (both sides)

C/R p 140 # 1, 3-5

We will mark C/R at the end of class.

The Blood

List the 4 types of cells and materials found in the blood. What is the function of each?

On the back: What is the order the blood flows through from the point that oxygen physically enters the body? (use below)

Capillaries, Heart, Lungs, arteries, veins

Name

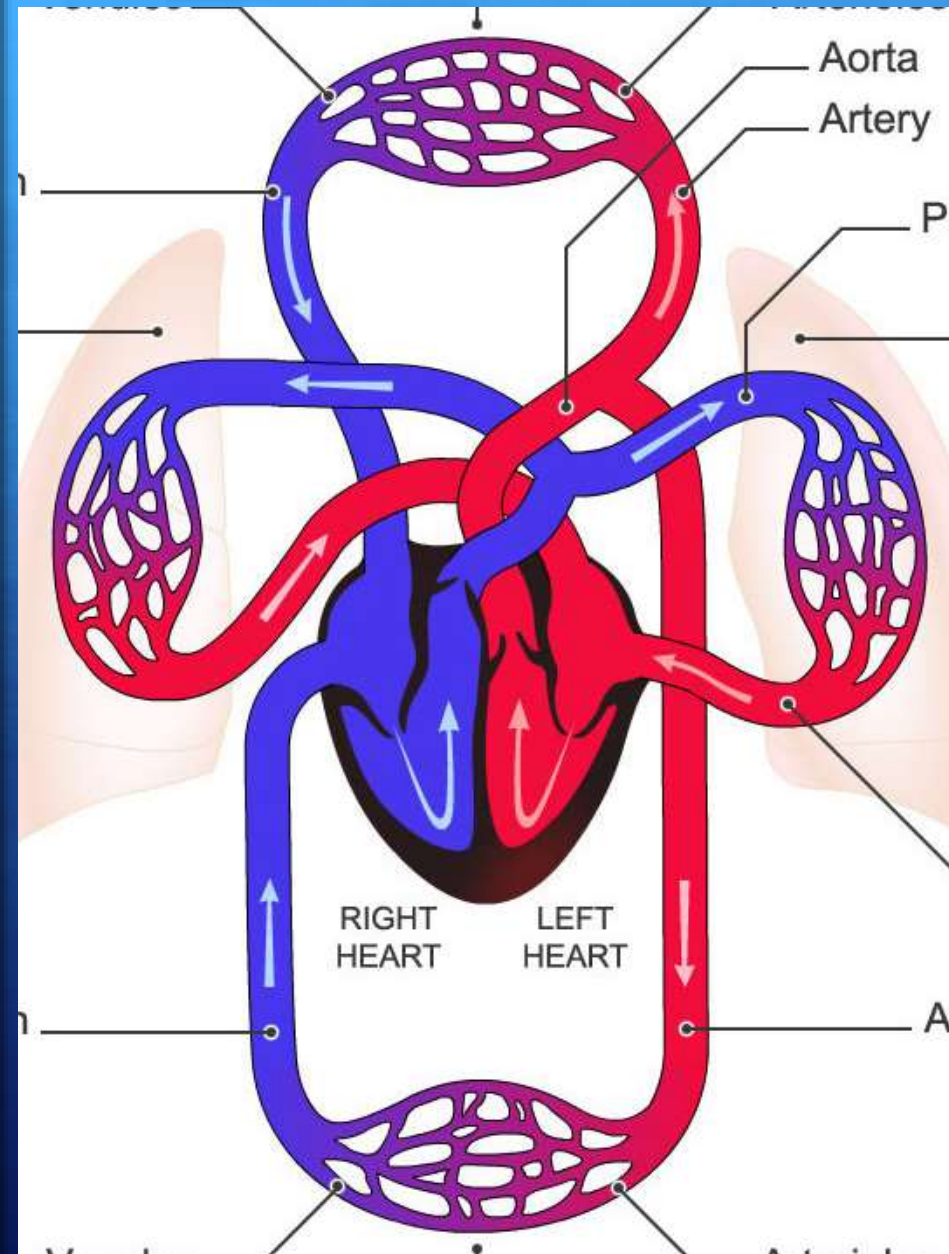

Circulatory System Quiz (11 marks)

Circulatory Quiz

1. The right side of the heart pumps blood to the

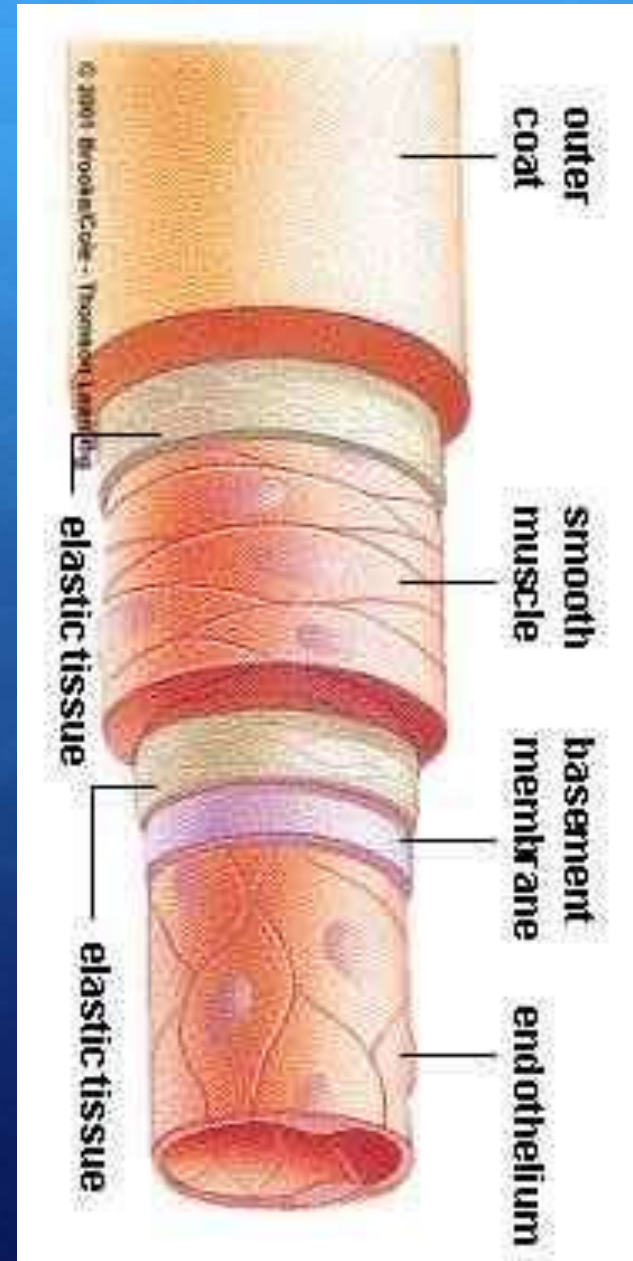

- a. Body
- b. Left Side of the Heart
- c. Lungs
- d. All of the above

Circulatory Quiz

2. Blood Vessels that carry high pressure blood AWAY from the heart are called

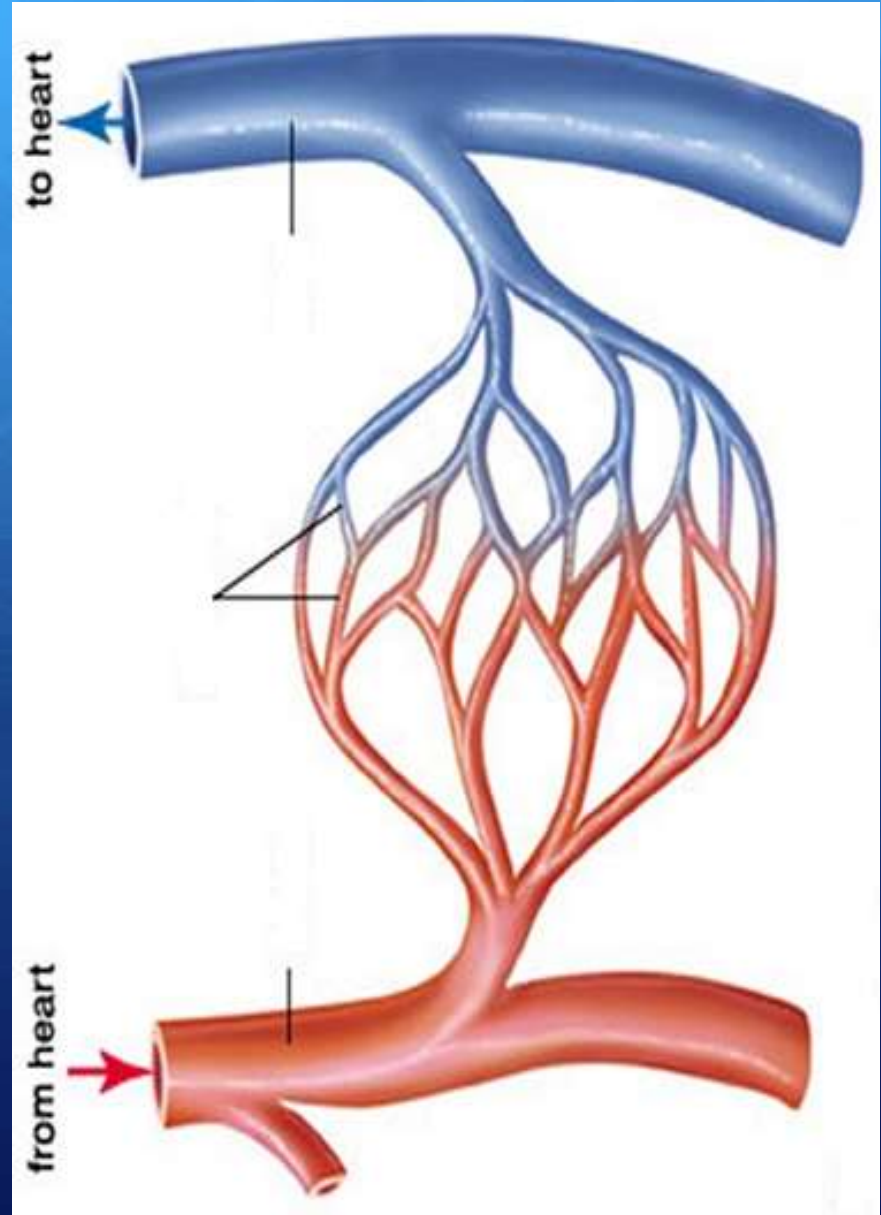

- a. Arteries
- b. Veins
- c. Capillaries
- d. Valves

Circulatory Quiz

3. What is the smallest type of blood vessel? Hint: They allow exchange of gas and nutrients to every cell in the body

- a. Arteries
- b. Veins
- c. Capillaries
- d. Aortas

Circulatory Quiz

4. The Atria of the heart
 - a. Collect blood from lungs and body
 - b. Squeeze blood out to lungs and body
 - c. Load the Ventricles
 - d. Collect blood from ventricles
 - e. Both a and c
 - f. Both b and d

Circulatory Quiz

5. Which type of blood vessel has valves to prevent blood from traveling the wrong direction during the resting phase of the heartbeat?

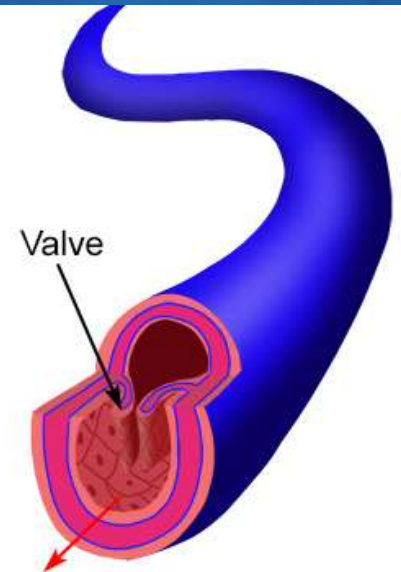

- a. Capillaries
- b. Veins
- c. Arteries
- d. Aorta

Blood flowing to heart

Healthy valve prevents reverse blood flow

Circulatory Quiz

6. Which chamber of the heart has the most muscle tissue surrounding it?

WHY? (2 marks)

- a. Right Atrium
- b. Left Atrium
- c. Right Ventricle
- d. Left Ventricle

7. List the four parts of blood (4 marks)

Circulatory Quiz

Excretory System

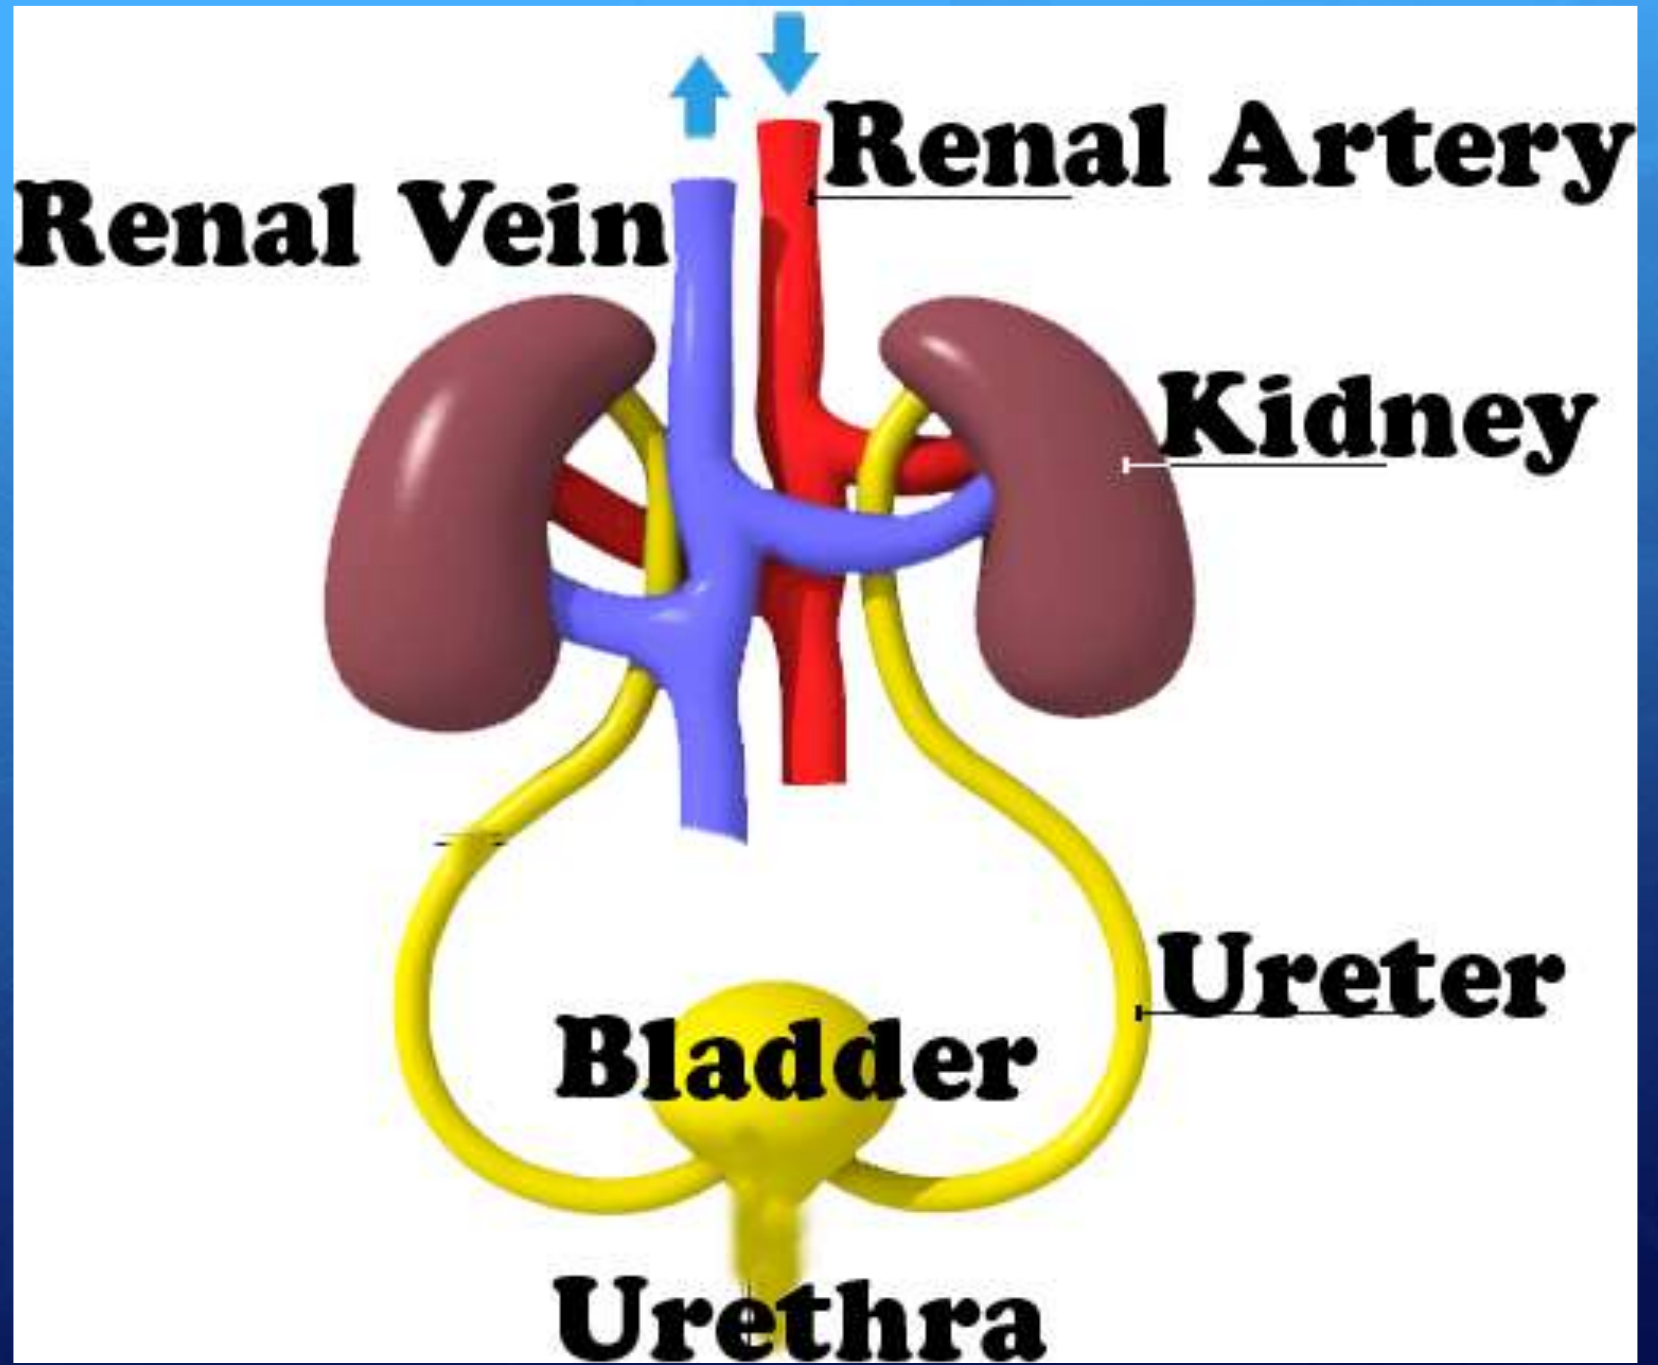

Excretion: The removal of metabolic (cellular) waste from the body.

Waste Products: Carbon dioxide (removed by lungs), Ammonia (from the break-down of proteins), salts, water. These are METABOLIC WASTES

Components of the Urinary System

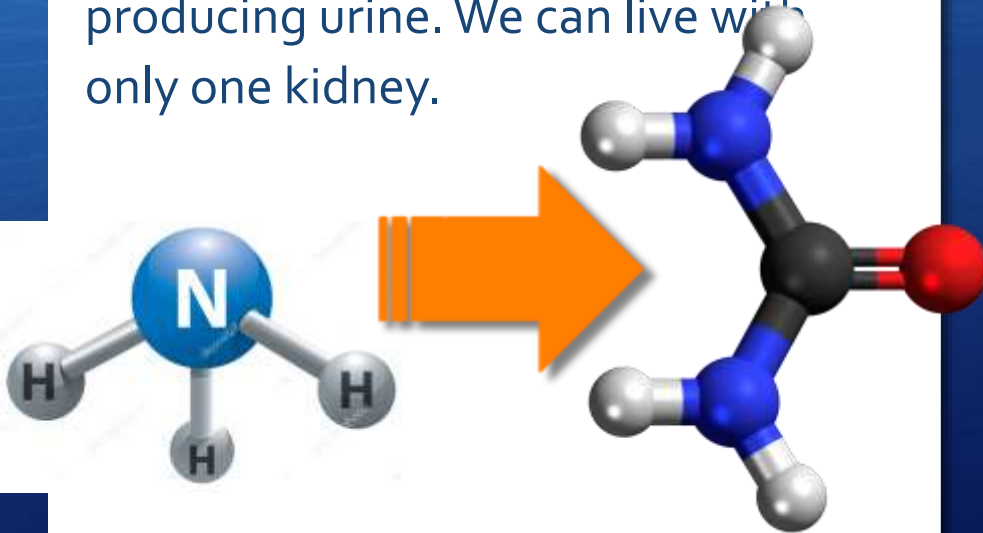

Excretory System

The Liver: Removes toxic ammonia from the blood stream and turns it into **Urea**. Urea is also toxic, but can be converted to Urine by the kidneys.

What else does the liver do?

The Kidneys: Filter the blood. Take out urea, extra water, and salts, producing urine. We can live with only one kidney.

ADAM.

Anatomy of the Kidney

The Formation of Urine

- Nephrons:
 - Microscopic filtering units inside the kidney that clean blood.

Skin: Excess salt removed when we sweat

Nephrons

Portion of a Glomerulus

Pedicle

PUT IT ALL TOGETHER:

Cells produce ammonia

Liver turns ammonia to urea

Kidneys add water and salt to urea to form urine

Liver

Renal artery

Renal vein

Left kidney

Right kidney

Ureters

Urinary bladder

Urethra

Urine can reveal diseases

If protein is found in urine: sign on kidney failure

If glucose is found in urine: sign of diabetes

Dialysis: A way to artificially clean the blood if a person's kidney's shut down

<https://www.youtube.com/watch?v=IQKQ4eoKfTg>

Your tests reveal that you are retaining fluids!

THE URINARY SYSTEM

Your Assignment

- Excretory Handout
- C/R p 145 # 2-4
- On the same piece of paper as C/R:
List the 4 organs in the excretory system

EXCRETORY System

Quiz

What do we call the removal of waste products from an organism?

excretion

+ What are the different systems used to bring necessities to the cell and carry away wastes?

Respiratory

Circulatory

Digestive

Excretory

What are all the chemical processes going on in the body called?

metabolism

+ The chemical processes of the body creates waste, what if these wastes build up?

death

Some **chemical** wastes include?

What are some of the organs of the excretory system?

- + CO₂
- + H₂O
- + Nitrogen
- + Salts
- + Heat
- + And more

Liver

Kidneys

SKIN

The Urinary System

+ What are some of the parts of the urinary system?

Kidneys

Ureters

Kidneys

Ureters

Bladder

Urethra

Kidneys

+ The kidneys are responsible for filtering the **blood**.

The clean blood is returned to the circulatory system. What's left is the excess water, salts, and other wastes. This wastewater is called urine.

The wastewater from the kidney drains into a tube called the

Ureter

+ These tubes connect the kidney and the

Bladder

allowing the urine to drain from the kidneys to the bladder.

The bladder is an elastic, muscular organ, that holds urine. When the bladder is full the urine leaves the body through a tube called the

Urethra

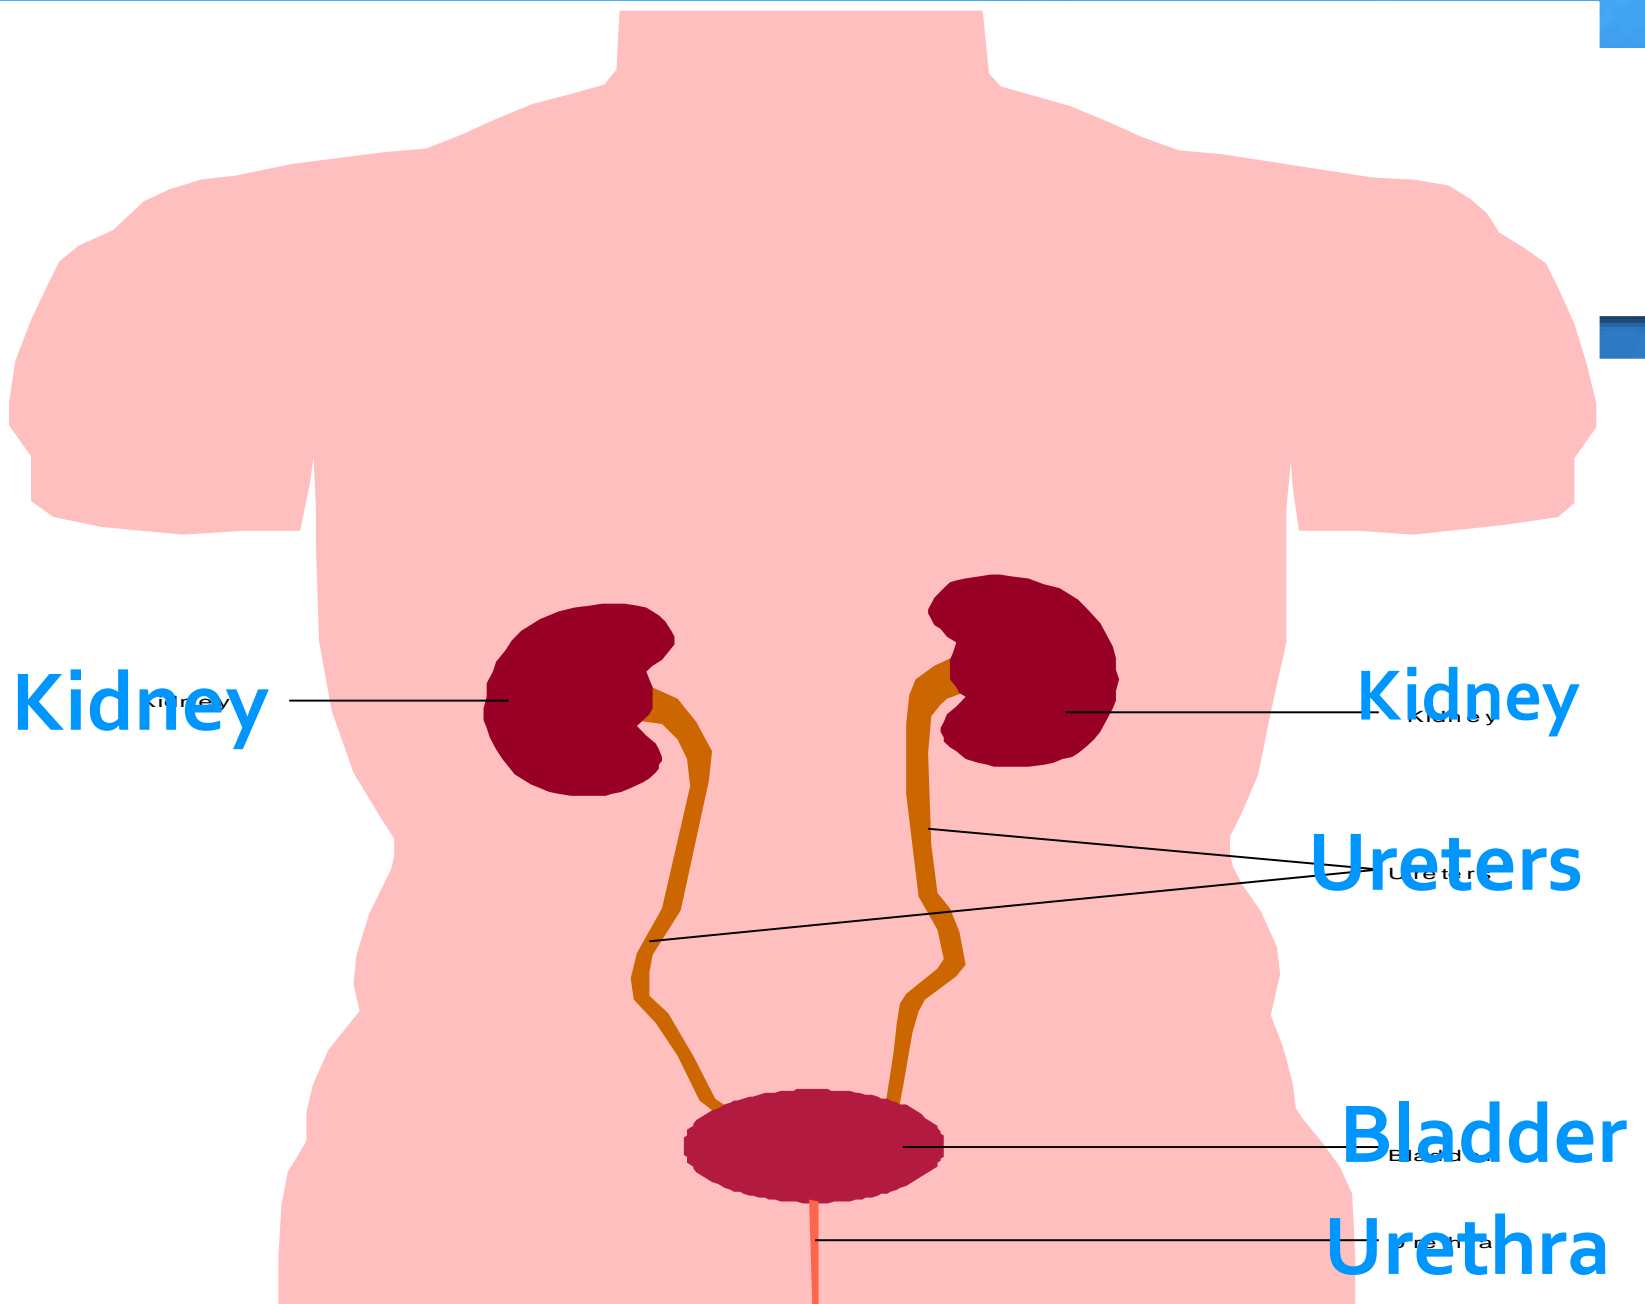

Kidney

Kidney

Ureters

Bladder

Urethra

When a person's kidneys are not functioning, they must undergo a process called **Dialysis** in which a machine filters the waste out of the blood.

Liver

+ The liver also is an organ of the excretory system.

+ The liver converts

Ammonia

To: ***Urea***

Skin

+ The skin helps eliminate salts as well as other waste products.

The skin eliminates:

Salt

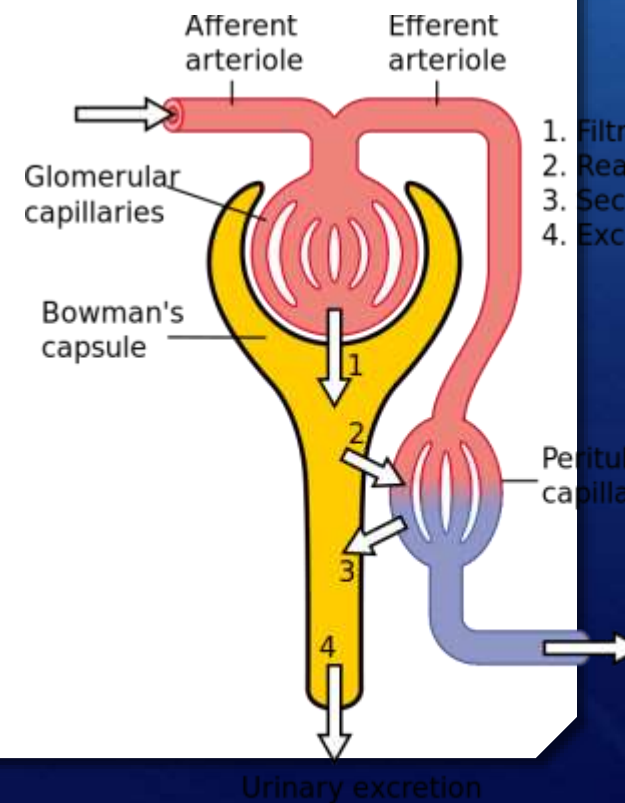

1. Which of the following is not part of the excretory system?

- + A. Skin
- + B. Ureter
- + C. Liver
- + D. appendix

2. Excretion is:

- + A. the removal of indigestible wastes only
- + B. Release of energy from food
- + C. Removal of Metabolic Wastes
- + D. Dissolving of insoluble foods

3. What is responsible for filtering the blood?

- + A. Lungs
- + B. Kidneys
- + C. Bladder
- + D. Urethra

4. Where does urine leave the body from?

- + A. Bladder
- + B. Urethra
- + C. Ureter
- + D. Dialysis

5. Which part of the urinary system are the arrows pointing?

- + A. Urethras
- + B. Dialysis
- + C. Ureters
- + D. Bladder

6. Which organ is responsible for turning ammonia into urea

- + A. Bladder
- + B. Lungs
- + C. Liver
- + D. Skin

7. What is the process by which a machine does the work of the kidneys?

- + A. metabolism
- + B. respiration
- + C. perspiration
- + D. dialysis

8. What is the removal of waste products from an organism?

- + A. excretion
- + B. secretion
- + C. dialysis
- + D. metabolism

fa23599663 FreeArt ©

9. Why do some people need kidney dialysis

- + A. They have a disease prevents proper kidney function
- + B. They have an injury that prevents kidney function
- + C. Their kidney's cannot filter out protein from their urine
- + D. All of the above

10. What other system is the respiratory system directly linked?

- + A. Digestive System
- + B. Perspiratory System
- + C. Circulatory System
- + D. Secretion System

Circulatory Review

Nervous System

-Use your textbook (p 146) to fill out the notes up to Axon.

-Get a partner: Do the “Knee Jerk Response”

- Which side is more sensitive?
- Do you have control of this response?
- What other things happen in your body that you don't have any control of?
- What do you have control of?

© 2000 John Wiley & Sons, Inc.

Paper clip sensitivity test with partners

Nervous System Notes

Nervous Tissue: Brain, Spinal Cord, and Nerves

Neurons: Specialized cells in the nervous system that transmit and receive information

Dendrites: Small Branches of a neuron that receive information from neighboring neurons

Axon: Long extensions of the neuron used to transmit information to neighboring cells.

Nervous System

-Human Reaction Time Lab

Nervous System

- Science:

- Stimulus
- CNS / PNS
- Nervous System Diagram
- Bill Nye: "The Brain," plus handout

- Math:

- 6.3 and 6.4 Notes
- P 264: 1, 2, 3, 5, 7(calculate), 8, 9, 10, 13, 15, 17
- WK 6.1 / 6.2 (Hand in Tomorrow)

The Nervous System

Can you think of an example of a stimulus?

What are stimuli outside our bodies?

What are stimuli inside our bodies?

"Stimulus, response! Stimulus, response! Don't you ever think?"

The Nervous System

It is the job of our nervous system to monitor and respond to stimuli

How the nervous system is organized (notes)

- Two main divisions:
 - The central nervous system** is composed of the brain and spinal chord
 - The peripheral nervous system** is composed of the nerves that travel to all parts of the body
- Draw the Nervous System Diagram. Human Body Video

The brain has over 100 billion neurons

The Peripheral Nervous System

2 Types of Neurons (notes)

- Sensory Neurons: Carry signals from the body to the Brain (CNS). Where could these signals be sent from?

- Motor Neurons: Carry signals from the brain (CNS) to the body. Examples:

10 minutes: Human Body: pushing the limits

The two most important parts of the nervous system are the **Peripheral Nervous System**, which is made up of **cranial and peripheral nerves**, and the **Central Nervous System** which is made up of the **brain and spinal cord**

Under Yesterday's diagram, write the following:

Tuesday Feb 23rd

- Stimulus Response Pathways
- Reflex Response
- Sensory / Motor Neuron Diagram
- Autonomic vs. Somatic Nervous system (try handout)

Sensory and Motor Neurons (PNS)

Try to follow the response pathway from the knee, to the CNS, and back to the knee:

<http://198.45.22.27/connecttext/psy/cho2/spinal.html>

What happens when our body needs to move very quickly? Think about putting your hand down on a hot stove; do you take time to think about moving your hand, or just move it?

Draw the sensory and motor neuron diagram

Peripheral Nervous system continued

- Autonomic Nervous System:
 - Instant, unconscious responses to stimuli. (No control over)
- Somatic Nervous System:
 - Controlled Responses to stimuli
 - Eg) Choosing to respond to something you hear

Think of some examples of each

Autonomic
Pain
Breathing
Heart Rate

Somatic

Central Nervous System

Wednesday Feb 24th 

Mark C / R p 151 #2-6

An Uneven Sense of Touch

Think back to the paper clip lab about what areas on your body are sensitive to touch

Draw diagram B on p 151 into your notes.

Human Body: Pushing The Limits
Video and handout

Nervous System Quiz

1. What are the two main divisions of the nervous system?
2. What is the difference between sensory and motor neurons?
3. Give an example of something your autonomic nervous system has done today
4. Give an example of something your somatic nervous system has done today

Nervous System Quiz

5. What are the two types of nerves in the peripheral nervous system (Hint: not motor and sensory)

6. Which type of neurons send impulses from the **body to the central nervous system?** (Hint: Sensory or Motor)

7. Which type of neurons send impulses from the **central nervous system to the body's muscles and organs?**

Nervous System Quiz

8. Which part of the nervous system is the control center for your whole body?

- a. Neuron
- b. Brain
- c. Spinal cord
- d. None of the above

Section 4: Health and Diseases

- What is health, what does it mean to be healthy??
- Have you ever broken a bone?
- Have you ever had a wound that sent you to the hospital?
- Have you ever needed stitches?

Smallpox

From the 1600 to 1800 a terrible disease swept through Europe

Victims broke out in a rash, got chills, fever, nausea, and muscle aches. **40% died from the illness**

Millions upon millions were killed by smallpox.

Great news! Smallpox has been eradicated! We no longer have to worry about it thanks to VACCINES !

[SMALLPOXTED XTALK](#)

The beauty of science

One of the most malicious diseases to ever sweep the earth was also the source of one of the greatest discoveries in science:

VACCINES

Diseases affect the body in two ways:

Sickness

Immune Response

How Vaccines Work

Trigger an immune response without actually causing the illness!!

The point is to make your immune system
Think your sick when you are really not

Then your body can build an immunity to
The virus and prevent your from getting
The strain that actually causes illness

The Smallpox Vaccine

- Edward Jenner
- Really quite simple: It took cows, milkmaids and one very observant man.
- cowpox (Demo)
